

AUTOCOMPLETION FOR STRUCTURED QUERYING

Explosion in Structured Data

Size of data is increasing...

...and so is its complexity

More data, More querying

2

- *What's new?*
 - ▣ Explosion of **structured** data
 - ▣ **Humans** as **primary** consumer of data

- Way we interact with data needs rethinking
 - ▣ Database Usability

Querying Structured Data

3

```
SELECT * FROM
(SELECT Top 1 t1.farmno, avg(t1.Mort0Pct) * 100 AS SixFlockAvgMort0,
min((AvgAdjustedPrimeCost2 - AdjustedPrimeCost) * 100) AS APCRating FROM
(SELECT top 6 zst.FarmNo, (cast(zst.MortalityWeek0 AS float) /
cast(zst.HeadPlaced AS float)) AS Mort0Pct, zst.settledate
FROM zrstSettle zst
WHERE zst.MinGuaranteeFlockExcludeFlag = 0
AND zst.ApprovedFlag = 1
AND zst.farmno = '2073'
ORDER BY zst.settledate DESC) t1
INNER JOIN zrstSettle ON t1.FarmNo = zrstSettle.FarmNo
WHERE zrstSettle.farmno = '2073' AND
zrstSettle.MinGuaranteeFlockExcludeFlag = 0
AND zrstSettle.ApprovedFlag = 1
GROUP BY t1.farmno, zrstSettle.settledate
ORDER BY SixFlockAvgMort0 DESC) t2
WHERE farmno = '2073'
ORDER BY t2.SixFlockAvgMort0 DESC
```

HARD

Querying Structured Data

4

something simple

Search

EASY

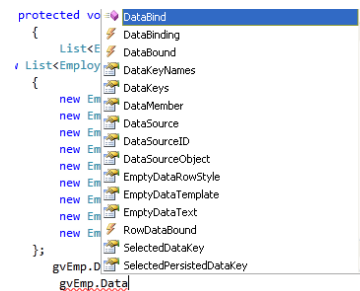

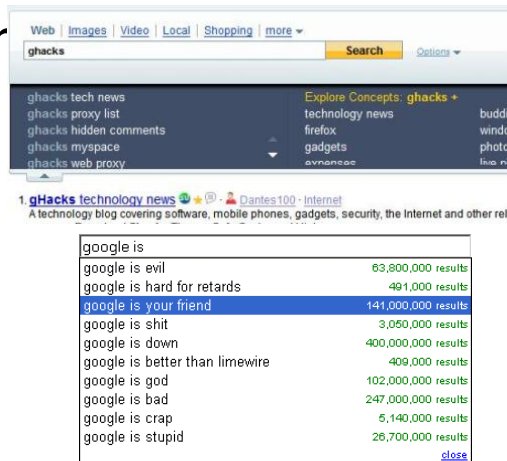

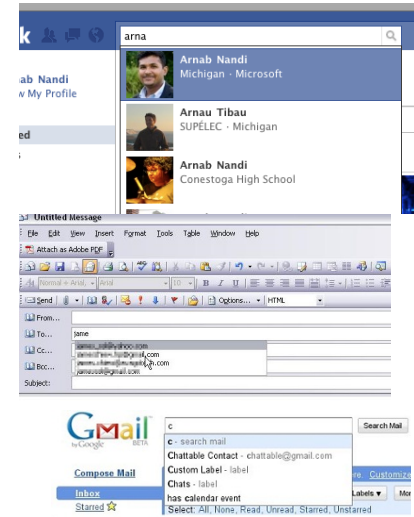

Auto-completion

5

etion

iance

- Mechanism that
- Autocompletion is everywhere
 - Command prompts
 - Code Editors
 - Email Clients / Addressbooks
 - Mobile phones
 - Search

Structured Data Enriches Querying

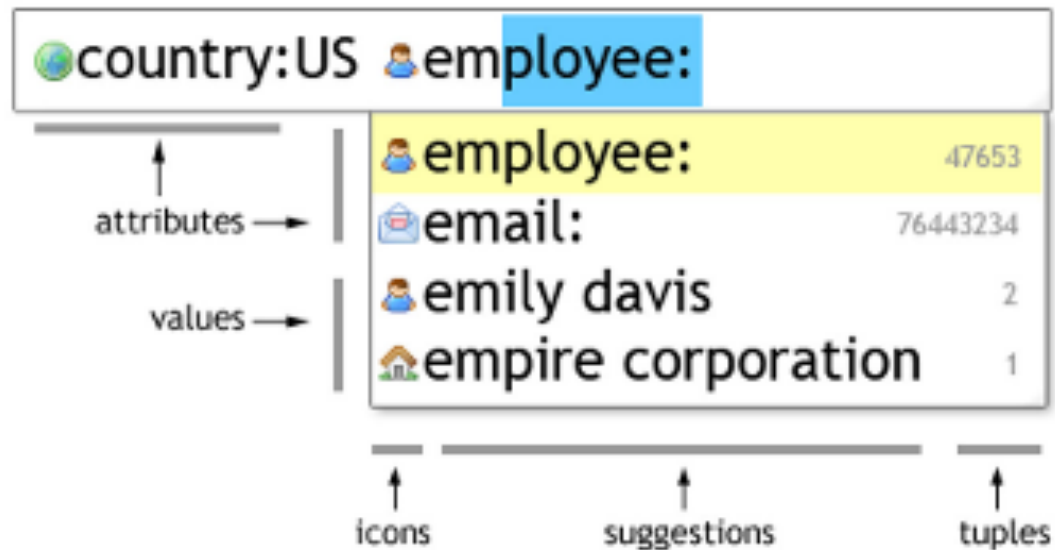

6

- The **type** of data matters
 - *movie:titanic* vs “*titanic*”
- **Multiple** independent criteria to identify entity of interest
 - *movie:titanic actor:leonardo*
- Criteria may be related only through non-obvious entities
 - *actor:leonardo actor:kate*

Completing Structured Queries

7

□ Structured Autocompletion Interface

Demo

8

- [Autocompletion Demo](#) ([alt link](#))

Challenges

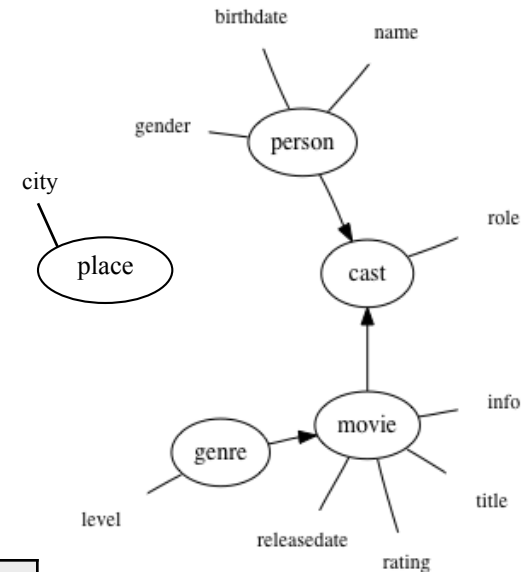

9

- Schema validation
- Context-sensitive Suggestions
- Latency

Schema Validation

10

- Some queries are not possible
 - ▣ There is no join connecting *city* and *movie title*
- Construct adjacency matrix
 - ▣ $O(1)$ lookup

	City	Title	Name
City	✓		
Title		✓	✓
Name			✓

Context-sensitive Suggestions

11

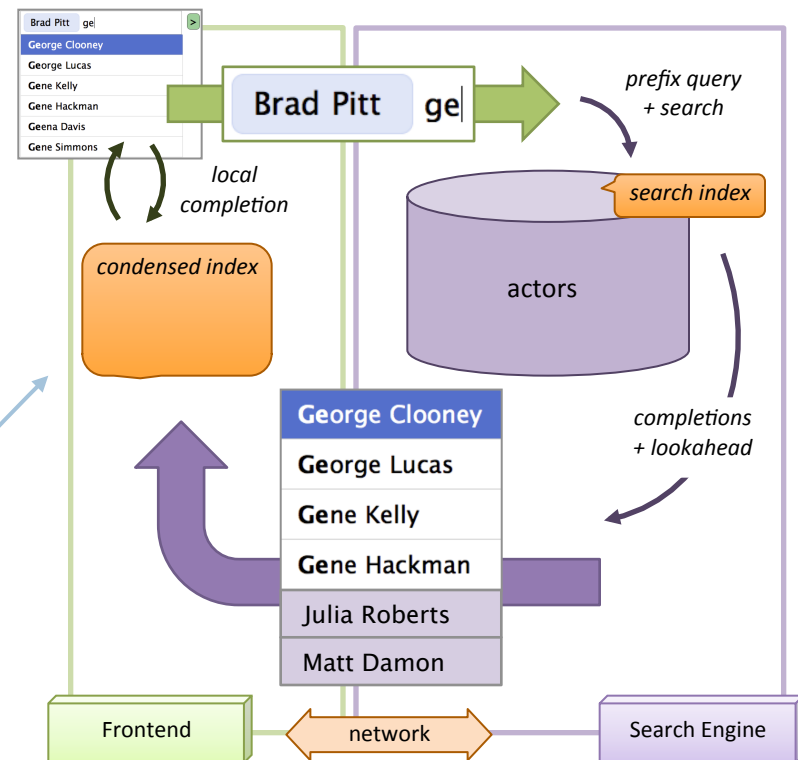

- Rerank suggestions based on existing entered terms.
 - ▣ Use both schema and instance information
- Construct conjunctive indexes for all token pairs, triplets, ...
 - ▣ Markov independence between terms (data dependent)

 country:US	 employee:	
 employee:		47653
 email:		76443234
 emily davis		2
 empire corporation		1

Latency

12

- Network + Search cannot keep up with each keystroke
- Ensure each suggestion takes $< 100\text{ms}$ to seem instantaneous
- Client-side Index

Anecdotal Results

13

An average of 60% Keystrokes Saved over a workload of 10 multi-token queries from AOL query logs on IMDB dataset, with PageRank and index of 1.9M names, 62K conjunctions
